

Interface Software

Continuously Exchanging Information. Simply.

Orion's *Interface Agent* is an architecture designed by Orion for the purpose of standardizing workforce data exchanges between diverse platforms. When combined with *Workforce Management PLUS* or *CourtNotify*, organizations can send, receive and validate complex, continuously changing data with other technology platforms. These data exchanges can occur on a real-time, or near real-time basis depending upon the needs of the system.

With the ability to send or receive interfaced data, one system can be declared the system of record. As a result, time is saved because redundant data entries are eliminated. What's more, outdated systems can be permanently retired and their maintenance cost eliminated.

BENEFITS

- Save time by automating workforce info exchanges with other systems
- Eliminate redundant, manual data entries
- Generate analytics using data received from external technology platforms

Interface Agent is independent of the data exchange method elected by the agency or external platform. As a result the data transport can take the form of file exchange, direct database connection, or web services without changing the fundamental methods used within Orion's platform. This allows for flexibility as to the location of external system's network location, security restriction, and application performance requirements.

All data validation, data transformation, and error management is subsequently conducted within the Orion application and database structure. This allows the system to provide front end user interfaces to update integration settings, type of data being exchanged, and the employees involved in the exchange.
